

APPLICATION LAUNCHER TESTING FRAMEWORK

ABSTRACT OF THE DISCLOSURE

5 An invention for an application launcher testing system is provided. The system includes an HTTP server that is in communication with an application launcher, and receives a query for a test application from the application launcher. A status server is also included that is in communication with the test application. The status server receives a test status from the test application. Further, the system includes a test monitor
10 that is in communication with the HTTP server and the status server. The test monitor receives a query status from the HTTP server and the test status from the status server.
